

## INSTALAR COMPOSER

Como requisitos previos, se supone que ya está instalado LAMP Server

<https://getcomposer.org/download/>

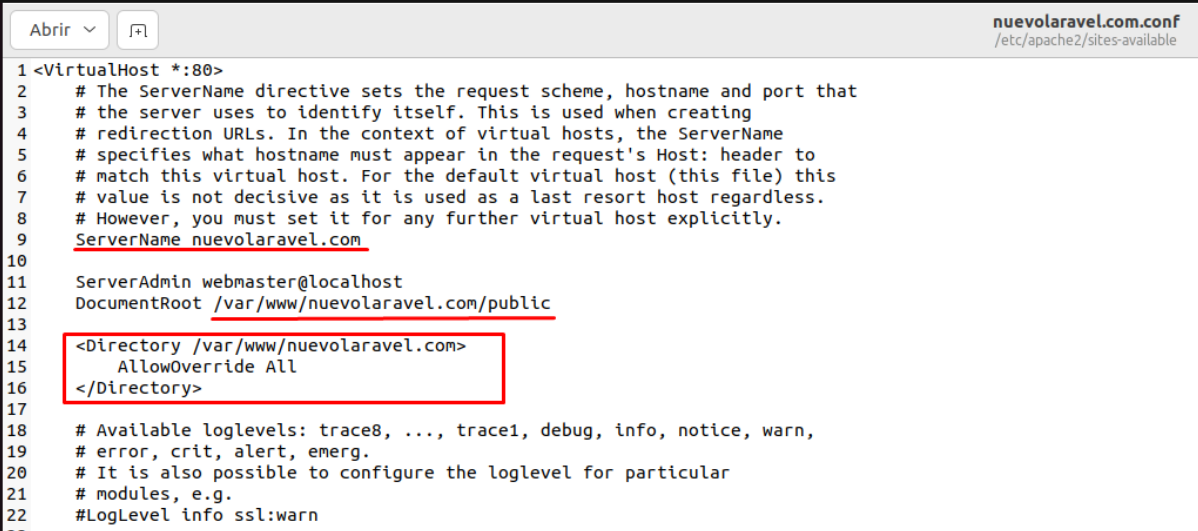

=====

```
sudo mkdir nuevolaravel.com
```

```
cd /etc/apache2/sites-available
```

```
sudo cp 000-default.conf nuevolaravel.com.conf
```

```
sudo gedit nuevolaravel.com.conf
```

```
1 <VirtualHost *:80>
2     # The ServerName directive sets the request scheme, hostname and port that
3     # the server uses to identify itself. This is used when creating
4     # redirection URLs. In the context of virtual hosts, the ServerName
5     # specifies what hostname must appear in the request's Host: header to
6     # match this virtual host. For the default virtual host (this file) this
7     # value is not decisive as it is used as a last resort host regardless.
8     # However, you must set it for any further virtual host explicitly.
9     ServerName nuevolaravel.com
10
11     ServerAdmin webmaster@localhost
12     DocumentRoot /var/www/nuevolaravel.com/public
13
14     <Directory /var/www/nuevolaravel.com>
15         AllowOverride All
16     </Directory>
17
18     # Available loglevels: trace8, ..., trace1, debug, info, notice, warn,
19     # error, crit, alert, emerg.
20     # It is also possible to configure the loglevel for particular
21     # modules, e.g.
22     #LogLevel info ssl:warn
```

```
sudo a2ensite nuevolaravel.com.conf
```

```
sudo service apache2 restart
```

```
sudo gedit /etc/hosts
```

```
127.0.0.1      nuevolaravel.com
```

```
cd /var/www
```

```
composer create-project laravel/laravel nuevolaravel.com "9.5" --prefer-dist
```

```
sudo chgrp -R www-data /var/www/nuevolaravel.com
```

```
sudo chmod -R 775 /var/www/nuevolaravel.com/storage
```

```
sudo a2enmod rewrite
```
